

Unit 6—Lesson 3:

Planning Implementation

Model, View, Controller

The model

Set up the model

- Represents data to be displayed, manipulated, and retrieved
- Comprises one or more classes (or objects) that separate data into logical groups
- Represents knowledge and expertise related to a specific problem domain
- Defined to match the real-world objects they represent

The model

Model objects

- Properties hold the encapsulated data of the object
- Methods (or functions) and computed properties provide the logic to manipulate the properties or perform actions on the object
- Initializers set up your objects before they are used for the first time

The view

- List the different views or scenes your app will display
- Determine which views or scenes you can reuse
- Determine the types of views that you can use to display the data:
 - Table view
 - Custom table view
 - Detail screen
 - Labels

The controller

- View controllers—Control a view and its subviews
- Model controllers—Control a collection of model objects
- Helper controllers—Consolidate related data or functionality that can be accessed by other objects
